

Testing Quick Reference Handbooks in Flight Simulators

Anthony Berg (200871682)
Supervisor: Dr Leo Freitas

14th May 2024

Preface

Abstract

This is an abstract.

Declaration

I declare that this dissertation represents my own work except where otherwise stated.

Acknowledgements

I would like to thank my supervisor Leo Freitas for supporting, guiding, and providing with areas of improvement for me throughout the project.

Chapter 1

Introduction

1.1 Scene

- Designing Emergency Checklists is difficult
- Procedures in checklists must be tested in simulators [1], which usually means trained pilots test it, as the tests need to work consistently [2] (making sure it's not lengthy, concise and gets critical procedures)
- Checklists are usually carried out in high workload environments, especially emergency ones

1.2 Motivation

- Testing procedures in checklists are often neglected [1]
- There are some checklists that may not be fit for certain scenarios - e.g. ditching (water landing) checklist for US Airways Flight 1549 assumed at least one engine was running [3], but in this scenario, there were none
- Some checklists may make pilots 'stuck' - not widely implemented, could be fixed with 'opt out' points. e.g. US Airways 1549, plane below 3000ft, could have skip to later in the checklist to something like turn on APU, otherwise plane will have limited control [3].
- Checklists may take too long to carry out - Swissair 111

1.3 Aim

The goal of this project is to test checklists in Quick Reference Handbooks (QRH) for flaws that could compromise the aircraft and making sure that the tests can be completed in a reasonable amount of time by pilots. It is also crucial to make sure that the tests are reproducible in the same flight conditions and a variety of flight conditions.

1.4 Objectives

1. Research current checklists that may be problematic and are testable in the QRH tester being made
2. Implement a formal model that runs through checklists, with the research gathered to produce an accurate test
 - (a) Understand the relative states of the aircraft that need to be captured
 - (b) Ensure that the results of the checklist procedures are consistent
3. Implement a QRH tester manager that
 - Runs the formal model and reacts to the output of the formal model

- Connect to a flight simulator to run actions from the formal model
- Implement checklist procedures to be tested, run them, and get feedback on how well the procedure ran

Chapter 2

Background

2.1 Hypothesis

- Checklists can be tested in a simulated environment to find flaws in checklist for things like
 - Can be done in an amount of time that will not endanger aircraft
 - Provides reproducible results
 - Procedures will not endanger aircraft or crew further (Crew referring to Checklist Manifesto with the cargo door blowout)
- Results in being able to see where to improve checklists

2.2 Safety in Aviation

2.2.1 History

- 70-80% of aviation accidents are attributed to human factors [4]

2.2.2 Checklists

- Checklists have been shown to aid in minimising human errors [2]
- However, checklists can be misleading and compromise the safety of the aircraft due to them being either too confusing or taking too long to complete [1]
- That is why testing checklists are important to avoid these situations

2.3 Formal Methods

2.3.1 History

2.3.2 Application

2.4 Solution Stack

- There would be around 3 main components to this tester
 - Formal Model
 - Flight Simulator plugin
 - Checklist Tester (to connect the formal model and flight simulator)
- As VDM-SL is being used, it uses VDMJ to parse the model [5]. This was a starting point for the tech stack, as VDMJ is also open source.
- VDMJ is written in Java [5], therefore to simplify implementing VDMJ into the Checklist Tester, it would be logical to use a Java virtual machine (JVM) language.

2.4.1 Formal Model

- There were a few ways of implementing the formal model into another application
- Some of these methods were provided by Overture [6]
 - RemoteControl interface
 - VDMTools API [7]
- However, both of these methods did not suit what was required as most of the documentation for RemoteControl was designed for the Overture Tool IDE. VDMTools may have handled the formal model differently
- The choice was to create a VDMJ wrapper, as the modules are available on Maven

2.4.2 Checklist Tester

JVM Language

- There are multiple languages that are made for or support JVMs [8]
- Requirements for language
 - Be able to interact with Java code because of VDMJ
 - Have Graphical User Interface (GUI) libraries
 - Have good support (the more popular, the more resources available)
- The main contenders were Java and Kotlin [9]
- Kotlin [9] was the choice in the end as Google has been putting Kotlin first instead of Java. Kotlin also requires less boilerplate code (e.g. getters and setters) [10]

Graphical User Interface

- As the tester is going to include a UI, the language choice was still important
- There are a variety of GUI libraries to consider using
 - JavaFX [11]
 - Swing [12]
 - Compose Multiplatform [13]
- The decision was to use Compose Multiplatform in the end, due to time limitations and having prior experience in using Flutter [14]
- Compose Multiplatform has the ability to create a desktop application and a server, which would allow for leeway if a server would be needed

2.4.3 Flight Simulator Plugin

- There are two main choices for flight simulators that can be used for professional simulation
 - X-Plane [15]
 - Prepar3D [16]
- X-Plane was the choice due to having better documentation for the SDK, and a variety of development libraries for the simulator itself
- For the plugin itself, there was already a solution developed by NASA, X-Plane Connect [17] that is more appropriate due to the time limitations and would be more likely to be reliable as it has been developed since 2015

Chapter 3

Design/Implementation

3.1 Components

Splitting up the project into multiple components has been useful for

- Aiding in planning to make the implementation more efficient
- Delegating specific work tasks
- Making the project modular, for example, allowing for a different simulator to be implemented with minimal need to refactor other parts of the codebase

Figure 3.1: Abstract layout of components

Each of the components in Figure 3.1 will be covered in detail in this chapter.

3.2 Formal Method

- Formal modelling is the heart of the logic for testing checklists
- Formal model created using VDM-SL
- It allows to test that the checklists have been completed in a proper manner - and that it is provable
- Model keeps track of
 - Aircraft state
 - Checklist state
- If an error were to occur in the model, this can be relayed that there was something wrong with running the test for the checklist, such as:
 - Procedure compromises integrity of aircraft
 - There is not enough time to complete the procedure
 - There is a contradiction with the steps of the checklist

3.3 Checklist Tester

Brief overview of what it is supposed to do...

3.3.1 Designing

- Used Figma to create a design for the application
- Allows for implementing the front end to be faster because:
 - They act as a requirement for code
 - You do not forget what needs to be implemented
 - Keeps everything consistent
 - Allows to think about making parts of the GUI modular and what components can be reused
- Figma allows for plugins such as Material 3 colours and Material 3 components
- Figure 3.2 is the final design that will be used for the program

Limitations of Figma

- The Material 3 Components in Figma do not include features that are available in Jetpack Compose
- In this project, the ‘Simulator Test’ at the bottom of Figure 3.2 does not include a leading icon [18], and therefore had to be a trailing checkbox
- This was overcome by adding comments in Figma as a reminder of how the actual implementation should be like
- Another limitation is that in Figure 3.2, the title of the screen in the top app bar [19] is not centered, and that is because the auto layout feature in Figma allows for equal spacing, rather than having each in a set position

3.3.2 Compose Multiplatform

Setup

- Used the *Kotlin Multiplatform Wizard* to create projects as it allows for runtime environments to be specified (in this case, Desktop and Server)
- Provides necessary build configurations in Gradle
- Planning what to implement important as Compose is designed to use modular components, otherwise a nested mess would occur as Compose is designed to have Composable functions passed in to a Composable function and therefore by design function nests will occur and the code will be harder to read if not managed correctly. Listing 3.1 shows example of using modular code from the Actions screen in project (with code omissions shown in comments)
- Used Voyager [20] to handle screens
- Used Koin [21] for dependency injection, to be able to get data from the database and VDMJ
 - Chose to use it because of Voyager integration with Koin [22]
 - Required as the application will be unresponsive when making requests to the database and/or VDMJ
 - Used asynchronous coroutines to prevent the program from being blocked

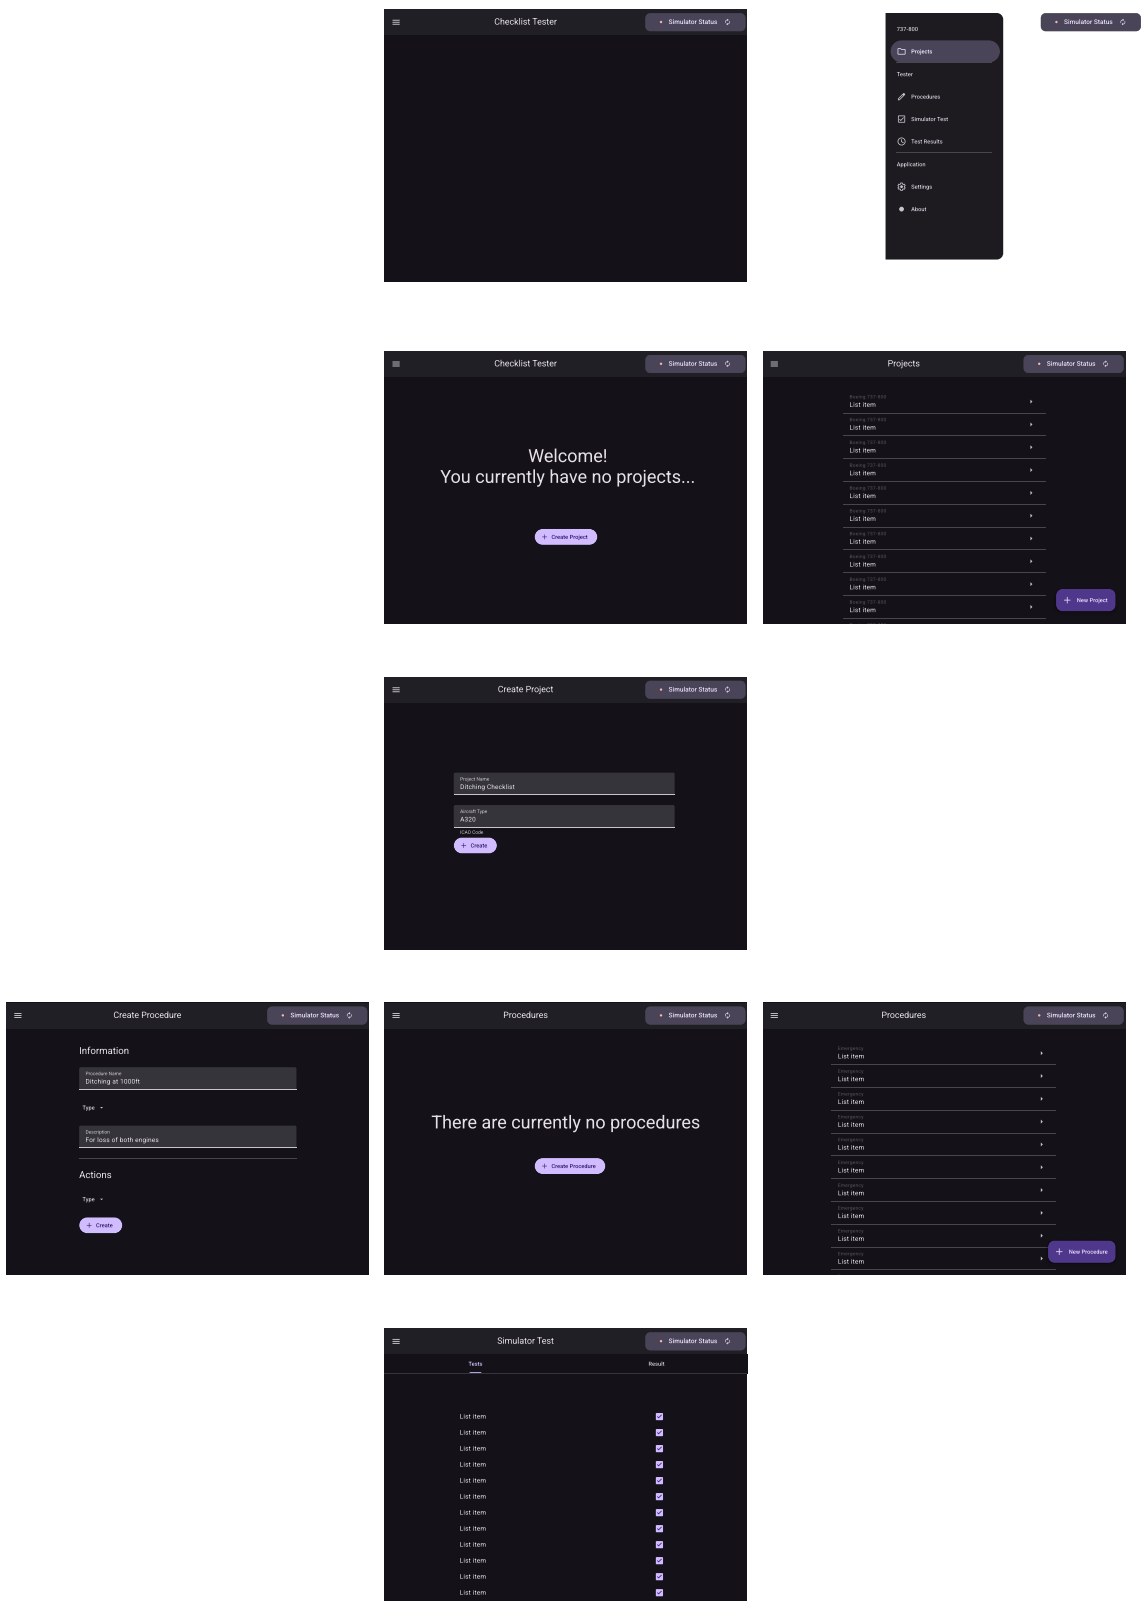

Figure 3.2: Design for the Checklist Connector GUI in Figma

```

1  @Composable
2  override fun Content() {
3      // Content variables...
4
5      Scaffold(
6          topBar = { /* Composable content... */ },
7      ) {
8          Column(/* Column option parameters... */) {
9              Box(/* Box option parameters... */) {
10                 LazyColumn(/* LazyColumn option parameters... */) {
11
12                     item {
13                         Header()
14                     }
15
16                     items(
17                         items = inputs,
18                         key = { input -> input.id }
19                     ) { item ->
20                         ActionItem(item)
21                     }
22                 }
23             }
24         }
25     }
26 }
27
28 @Composable
29 private fun Header() {
30     Text(text = "Edit Actions")
31 }
32
33 @Composable
34 private fun ActionItem(item: Action) {
35     Column (/* Column option parameters... */) {
36         Row(/* Row option parameters... */) {
37             Text(text = "Action ${item.step + 1}")
38
39             IconButton(/* IconButton definition parameters... */) {
40                 Icon(
41                     Icons.Outlined.Delete,
42                     // Rest of Icon options...
43                 )
44             }
45         }
46
47         Row(/* Row option parameters... */) {
48             OutlinedTextField(/* TextField definition parameters... */)
49
50             OutlinedTextField(/* TextField definition parameters... */)
51         }
52
53         HorizontalDivider()
54     }
55 }

```

Listing 3.1: Example of modular code in Compose

3.3.3 Storing Data

- SQLDelight was used to handle the database by allowing for typesafe Kotlin APIs when interacting with the database. Specifically chosen as it provides support for Compose Multiplatform [23]
- It only allows for queries to be written in SQL, which would allow for more complex SQL queries if needed
- SQLite was used for the Relational Database Management System (RDBMS) as it is an embedded database [24], meaning that the database will run in the application, rather than running on a server, either remotely or through local containerization through something like Docker [25], which could take more time and add complexity as it means implementing additional dependencies
- SQLite also has 100% [26] which necessary for ensuring that the database will not cause artefacts to the results

Designing the Database

- The database could be thought as having 2 sections
 - The user inputs to control the tester, i.e. the steps a procedure contains. The tables for these are *Project*, *Procedure*, and *Action*
 - The test results for a procedure which are in the *Test*, and *ActionResult* tables
- The design of the database had relationships in mind as the goal was to have a detailed tracking of statistics for each step in the procedure, hence in Figure 3.3
- A *Procedure* can have multiple *Tests*, where each *Test* each contains the result of how each *Action* in *ActionResults*
- The choice of a *Project* was to allow for the segregation of testing different aircrafts, as each aircraft has different cockpit layouts and different systems

Implementing into Compose Multiplatform

- Compose Multiplatform has support for different runtime environments, however as this project was only being developed for Desktop, the JVM SQLite driver only had to be considered
- However, the functions for the database were written in the *shared/commonMain* module as there may be a potential for adding Android and iOS support as it as it may be helpful run the tests on a tablet
- A database transaction had two modules
 - A class handling SQLDelight API calls only; meaning no conversion of types, which are functions only accessible within module internally, which is located in *io.anthonyberg.connector.shared.database*
 - SDKs that can handle multiple tables, such as *TestTransaction* which handles database calls when checklists are being tested in the application. And allows for converting types, such as *Int* to *Long*
- The separation of these modules was to have in mind unit testing, as it will make it easier to debug if a problem is with SQLDelight transactions are handled, or if there is a conversion error occurring

3.3.5 Connecting to the Flight Simulator

3.3.6 Testing

3.4 Simulator Connector Plugin

3.4.1 Creating Maven Package

- XPC package is not published on a public Maven repository
- There has been a pull request that was merged to the *develop* branch that provides Maven POMs [27]. However, the maintainer for the project, at the time, did not have enough time to figure out the process of publishing the package to a Maven repository [28]
- Therefore, had to find an alternative way to implement
- Jitpack [29]
 - In theory, simple to publish a repository, all that is required is a GitHub repository and searching if one has already been created on JitPack or build and publish a specific version
 - However, due to the structure of the XPC repository, JitPack could not locate the build tools (Apache Maven in this case) as JitPack only searches on the root directory for the compatible build tools
- Gradle gitRepository [30]
 - There was not a lot of documentation
 - Ambiguous on how to define directory for where the Java library is located in the Git repository
 - However, as XPC was only built with Maven, Gradle was not able add the dependency as `gitRepository()` only works with Gradle builds [31]
- Resorted to using a compiled Jar file and adding the dependency to Gradle
- Not happy about that because it means maintaining it will be more difficult as it is not as simple as just changing the version number
- Later, resorted to adding Gradle build files to XPC
- Used automatic conversion from Maven to Gradle using `gradle init` command [32]
- Had to add local dependencies due to how Gradle works differently
- Had to fix previous structure of Maven POM as the grouping as not good

3.4.2 Submitting a Pull Request

3.5 Scenarios

- Use a Quick Reference Handbook (QRH) to find potential list of checklists to test
- Look at previous accident reports that had an incident related to checklists and test it with my tool to see if it will pick it up
- These previous accident reports can be good metrics to know what statistics to look out for
